REPAIRO STRATEGIC EXECUTION DOCUMENT

B2B SaaS Strategic Analysis, Market Dynamics & Roadmap

1. QUANTITATIVE DATA ON API BREAKING CHANGES & VOLATILITY

The assumption that APIs serve as immutable, highly governed contracts is false. Software systems evolve continuously, leading to "API drift" where implemented code diverges from the published specification, causing silent downstream failures.

- **41% Monthly Spec Drift (KushoAI 2026):** 41% of third-party APIs experience schema drift within 30 days, rising to 63% within 90 days.
- **The Deprecation Crisis (RADA Study of 2,224 OpenAPI specs):**
  - 87.3% of breaking API versions failed to officially deprecate the affected operations in the prior version.
  - 38% of deprecating APIs deprecate over 50% of their operations, requiring architectural rewrites rather than incremental patches.
  - 65% of impacted operations involved altered request parameters.
  - Less than 1.5% of studied APIs used proactive machine-readable warnings (like HTTP deprecation headers).
- **AI/ML API Volatility (Nordic APIs 2026):** Generative AI APIs are exceptionally volatile. OpenAI had ~11 outages/changes in a single month (Jan 2026), averaging one every 2.5 days.
- **Financial & Productivity Toll:** API downtime costs up to $200,000 per hour. Main branch success rates dropped to 70.8% due to CI failures. Developers waste 3 hours per week diagnosing API breaks.

2. COMPETITIVE LANDSCAPE & TECHNICAL MOAT

Competitor / Category	Core Function	Remediation Capability	Technical Limitation for Consumers
Postman / Akita	API monitoring & discovery	None (Alerting only)	Places the full manual refactoring burden on the client team.
Speakeasy	Spec-to-SDK generation & linting	SDK Re-gen only	Does not patch client-side consumer code.
Pact / PactFlow	Contract testing	None (Build block)	Useless for third-party APIs you don't control.
Dependabot	Dependency version updates	Version bumps only	Ignorant of code logic; causes compile breaks.
Repairo	**Drift Detection + AST Mapping**	**Full AST PRs**	**Deterministic, self-healing code repair in 24ms.**

3. CORPORATE STRUCTURE: US "TOPCO" + INDIAN "OPCO" FLIP

- **Delaware C-Corp (TopCo):** Standard for VC investment (YC, Sequoia). Section 1202 QSBS offers up to $10M tax exclusion on exit. ESOPs are seamlessly managed via Carta (standard 4-year vest / 1-year cliff).
- **Indian Pvt Ltd (OpCo):** Wholly-owned subsidiary to employ the local team. Funded by parent via **Cost-Plus Transfer Pricing (Sec 92-92F)** with a standard 10%-15% markup, maintaining full tax efficiency.

4. TWO-YEAR EXECUTION ROADMAP

Phase 1: Validation & MVP (Q1 - Q2)

- **Q1:** Finalize AST engine for TypeScript. Setup Delaware TopCo + Indian OpCo. Close $100k SAFE. Onboard Systems Lead (Sanjay).

- **Q2:** Build OpenAPI Specification monitor. Onboard 3-5 unpaid design partners. Hire 1x Senior Backend Engineer.

Phase 2: Public Beta & Monetization (Q3 - Q4)

- **Q3:** Launch self-serve GitHub App. Initiate SOC2 Type I audit using 24ms Volatile RAM Vault. Target 50 repositories.
- **Q4:** Expand AST support to Python. finalise SOC2 Type I. Implement Stripe billing ($99/mo). Apply/Enter Y-Combinator.

Phase 3: Commercial Scale & Venture Seed (Q5 - Q8)

- **Q5 - Q6:** Build GitLab/Bitbucket integrations. Scale to $10k-$20k MRR. Expand AST support to Go and Java.
- **Q7 - Q8:** Launch Pre-Merge CI/CD gates. Transition to enterprise sales ($15k-$30k ACV). Raise $1.5M Venture Seed Round.
